HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destin e au d p t et   la diffusion de documents scientifiques de niveau recherche, publi s ou non,  manant des  tablissements d'enseignement et de recherche fran ais ou  trangers, des laboratoires publics ou priv s.

Contributions of atomistic simulations to the understanding of the formation and evolution of defects in crystalline materials

Dr. Julien GUÉNOLÉ^{1,2}

¹ CNRS, Université de Lorraine, LEM3, Metz, France

julien.guenole@univ-lorraine.fr

To tackle the scientific and industrial challenges ahead, the availability of novel high-performance materials will be of prime importance. To this aim, modern laboratories and industries heavily rely on models and numerical simulations to foster the design of tailored properties materials. In this context, atomistic modelling provides a unique access to fundamental material mechanisms able to support innovative physics-based constitutive models for material design.

Here we present the contribution of atomistic simulations towards the development of higher-scale models, though the understanding of the plastic deformation of crystalline materials. The Molecular Dynamics method will be presented and compared with other approaches, such as Density Functional Theory approaches and Monte Carlo simulations. Then, examples of investigations will be presented and discussed. The dislocation absorption in GBs and the influence of internal strain on irradiation-induced damage will be shown as examples of inputs in higher scale models¹. The interplay of atomistic simulations and experiments will be highlighted through the investigation of irradiation damage², the formation of defects in MAX phases^{3,4}, the initiation of plasticity in nanowires^{5,6}, and the dislocation-interface interactions in metallic composites^{7,8} and superalloys⁹. The focus of this lecture will be the inputs provided by these atomistic simulations to higher scale techniques and the interplay with experiments.
